"Doctors have always recognized that every patient is unique, and doctors have always tried to tailor their treatments as best they can to individuals. You can match a blood transfusion to a blood type — that was an important discovery. What if matching a cancer cure to our genetic code was just as easy, just as standard? What if figuring out the right dose of medicine was as simple as taking our temperature?"

- President Obama, January 30, 2015

Definition of Precision Medicine

From the National Cancer Institute:

"A form of medicine that uses information about a person's genes, proteins and environment to prevent, diagnose and treat disease"

Evolving Definition of Precision Oncology

"Precision oncology is seductive and appealing.... But like all seductive notions, we must separate evidence supporting a claim from our desire for the claim to be true. In the case of precision medicine, we need clear definitions and criteria for success or failure. We are hoping for success, but there remains much imprecision to this strategy."

Vinay Prasad, MD, MPH, and Robert Peter Gale, MD, PhD, DSc(hc), FACP, FRSM

The ASCO Post

Evolving Definition of Precision Oncology

- **<u>2005-2010:</u> precision oncology predominantly described targeted therapies (e.g. bevacizumab, trastuzumab, imatinib)**

- **<u>2016 and onwards:</u> precision oncology refers to using data from Next-Generation Sequencing (NGS) to guide therapies**

- **Most "paradigm-shifting" definition of precision oncology:**
  - ***Directing therapy independent of cancer type as currently defined (based on anatomy and histology) and instead by gene mutations***

- **2017: first "tissue-agnostic" cancer treatment, pembrolizumab, for any microsatellite instability high (MSI-H) solid tumors**

Current Tissue Agnostic Approvals in Oncology

Therapy	Biomarker	*FDA approval date
Pembrolizumab	MSI-H or dMMR	May 2017
Larotrectinib	NTRK fusion	November 2018
Entrectinib	NTRK fusion	August 2019
Pembrolizumab	TMB-H (≥10 mut/Mb)	June 2020
Dostarlimab-gxly	dMMR	February 2022
Dabrafenib + Trametinib	BRAF V600E	June 2022
Selpercatinib	RET fusion	September 2022

*FDA approved all indications under accelerated approval program, continued approval may hinge upon confirmatory studies.

The Future of Precision Oncology: Multi-omics

"As the first of the omics, genomics revolutionized the diagnosis and treatment of specific diseases. Now that the knowledge of omics has progressed and expanded to include multiple omics (multi-omics), it is not sufficient to solely rely on genomics for personalized treatment plans…"

Multiomics in Precision Medicine
June 2022, Broad Institute (MIT), Boston, MA

The Future of Precision Oncology: Multi-omics

Patient phenotyping

- Tumor biopsy
- Standard clinical analyses
- Tumor omics profiling
- Host omics profiling
- Pharmacogenomics

Patient-directed tx

The Future of Precision Oncology: Multi-omics

	Approach	Definition	Common Technologies & Techniques
Tumor	Genomics	Focuses on structure, function, evolution, mapping and editing of information coded within an organism's genome	NGS: WGS, WES, targeted sequencing
Tumor	Epigenomics	How cells control gene activity through non-genetic modifications like DNA methylation and histone modification	NGS: methylation sequencing, ChIP-Seq, ATAC-seq, HiC/3C
Tumor	Transcriptomics	Study of transcriptome, the complete set of RNA transcripts that are produced by genome, and how it is altered in response to regulatory processes, splicing, disease, or other phenomena	NGS: mRNA-seq, whole transcriptome, targeted sequencing
Tumor	Proteomics	Characterize and identify protein expression patterns in response to specific stimuli or following genomic or transcriptomic changes	Mass spectrometry, mass cytometry, NGS-based detection (e.g. CITE-seq, Ab-seq)
Host	Metabolomics	Study of metabolome within cells, biofluids, or tissues to identify and quantify small molecules/metabolites (<1500 Daltons) in a biological system in a high-throughput manner	Nuclear magnetic resonance (NMR) spectrometry and mass spectrometry
Host	Microbiome	Community of microorganisms that live in or on a particular part of body, such as skin or GI tract; dynamic and change in response to exercise, diet, medications and other exposures	NGS: shotgun metagenomic sequencing, 16S rRNA sequencing, microbial metatranscriptomics
Host	Pharmacogenomics	Study of how genes affect a person's response to drugs	Targeted sequencing of genes with high evidence of drug-gene interactions (e.g. Invitae's 38 gene panel)

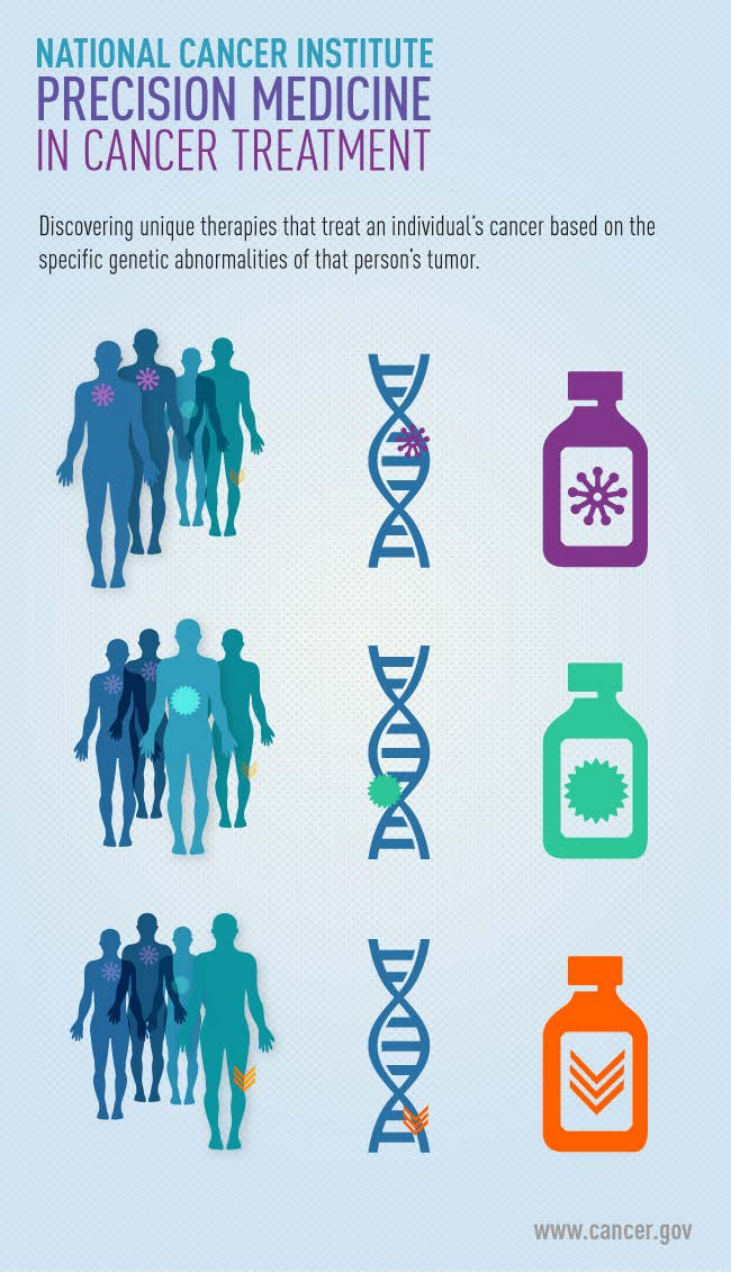
Presentation Outline

- Defining Precision Medicine
- NCI Precision Medicine Trials
- MCW Rare Cancer and Precision Medicine Clinic
- 2 Case Presentations



NIH Precision Medicine Initiative launched in 2016

- NIH invests $215 million to accelerate biomedical research and provide clinicians with new tools to select individualized therapies for patients

- $70 million for the NCI to advance the field of Precision Oncology, focusing on these key goals:
  - Expanding precision medicine clinical trials
    - Lung cancer master protocol (**Lung-MAP**)
    - Adjuvant Lung Cancer Enrichment Marker Identification and Sequencing Trials (**ALCHEMIST**)
    - Molecular Analysis for Therapy Choice (**NCI-MATCH**)
  - Overcoming drug resistance
  - Developing new laboratory models for research
    - NCI Patient-Derived Models Repository
  - Developing a national cancer knowledge system
    - Genomic Data Commons (**GDC**)
    - The Cancer Genome Atlas (**TCGA**): >20,000 primary cancer and matched normal samples sequenced, 33 cancer types; genomic, epigenomic, transcriptomic and proteomic data

THE CANCER GENOME ATLAS

NCI-MATCH: Molecular Analysis for Therapy Choice

NATIONAL CANCER INSTITUTE
NCI-MATCH CLINICAL TRIAL

THIS PRECISION MEDICINE TRIAL EXPLORES TREATING PATIENTS BASED ON THE MOLECULAR PROFILES OF THEIR TUMORS

NCI-MATCH* IS FOR ADULTS WITH:

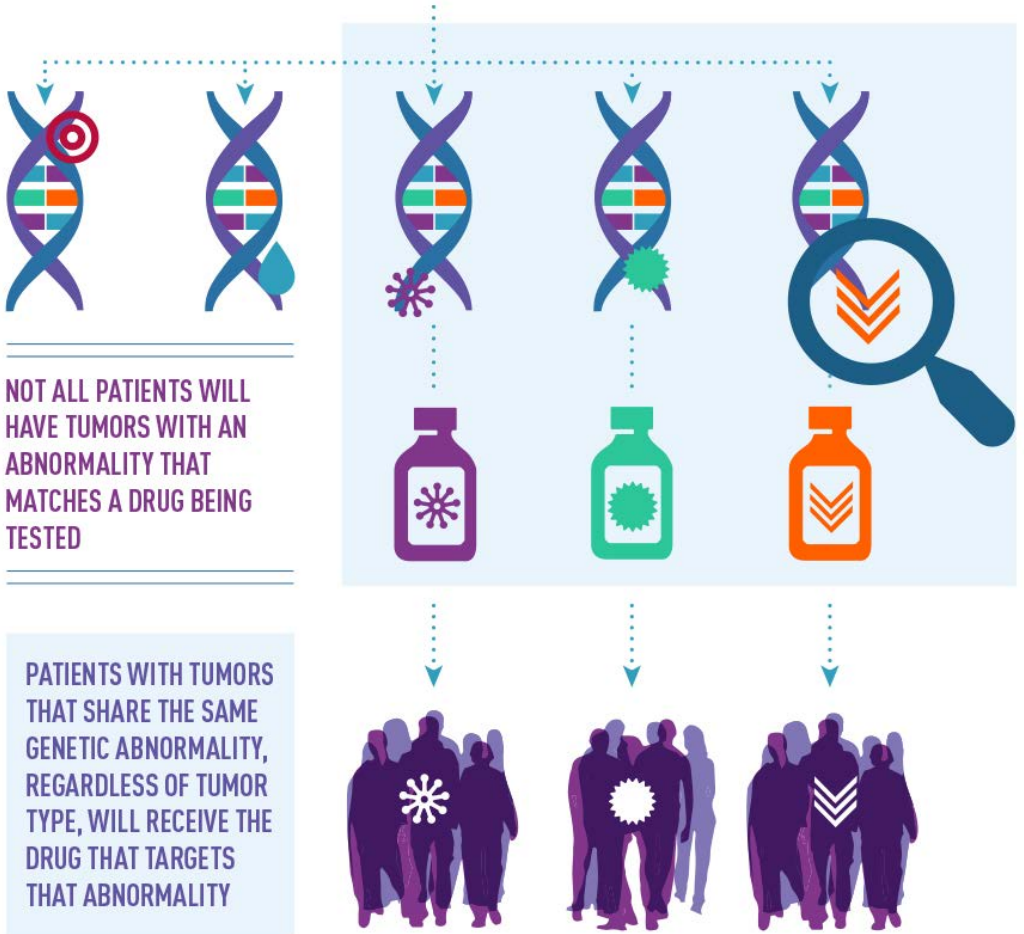
- solid tumors (including rare tumors) and lymphomas
- tumors that no longer respond to standard treatment

ABOUT 3,000 CANCER PATIENTS WILL BE SCREENED WITH A TUMOR BIOPSY

GENE SEQUENCING WILL LOOK FOR CHANGES IN 143 GENES

THE BIOPSIED TUMOR TISSUE WILL UNDERGO GENE SEQUENCING

IF A PATIENT'S TUMOR HAS A GENETIC ABNORMALITY THAT MATCHES ONE TARGETED BY A DRUG USED IN THE TRIAL, THE PATIENT WILL BE ELIGIBLE TO JOIN THE TREATMENT PORTION OF NCI-MATCH

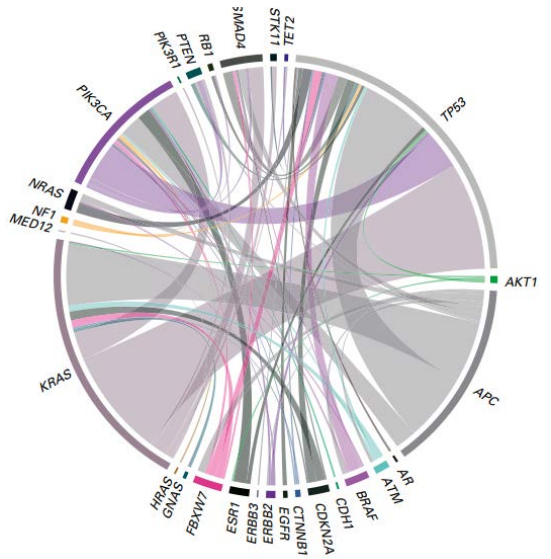


NOT ALL PATIENTS WILL HAVE TUMORS WITH AN ABNORMALITY THAT MATCHES A DRUG BEING TESTED

PATIENTS WITH TUMORS THAT SHARE THE SAME GENETIC ABNORMALITY, REGARDLESS OF TUMOR TYPE, WILL RECEIVE THE DRUG THAT TARGETS THAT ABNORMALITY

Journal of Clinical Oncology®

Molecular Landscape and Actionable Alterations in a Genomically Guided Cancer Clinical Trial: National Cancer Institute Molecular Analysis for Therapy Choice (NCI-MATCH)



- **5,954 patients at 1,117 accrual sites analyzed centrally with NGS & selected IHC**
- **Molecular profiling successful in 93.0% of specimens**
- **An actionable alteration was detected in 37.6%**
- **After applying clinical and molecular exclusion criteria, 17.8% were assigned to a subprotocol (total 39?)**
- **Actionability rates differed among histologies (>35% urothelial ca., <6% SCLC)**

Flaherty *et al.*, 2020

Next Generation of NCI NCTN Precision Oncology Trials

- **ComboMATCH (ECOG):** a successor to NCI-MATCH, which tested single drugs
  - Will test combination of targeted drugs in multiple specified patient subgroups supported by preclinical *in vivo* evidence
    - Robust preclinical *in vivo* evidence generated from PDX and CDX data
  - Goal: overcome drug resistance to single-agent therapy, higher RR to combination therapy

- **ImmunoMATCH (SWOG):** in development, master protocol focused on immunotherapy
  - Will perform centralized prospective molecular profiling of all patients based on well validated assays
    - Whole exome sequencing (TMB calculation, somatic variant identification)
    - Gene expression profiling, including generating a tumor inflammation signature
  - Based on results of centralized profiling, patients will be assigned to sub-studies
  - 2-stage pilot study NCT05136196 (cabo/nivo for melanoma and H&N cancer): confirm iMATCH assay platform can deliver results in 21 days

- **MyeloMATCH (SWOG):** soon to launch, umbrella trial to test treatments for AML and MDS
  - Evaluate both targeted and non-targeted agents
  - Evaluate role of MRD in AML

MCW Rare Cancers and Precision Medicine Clinic

Our treatment strategy integrates all aspects of routine oncology care, including but not limited to chemotherapy, radiotherapy and surgery, but *we emphasize genomically guided treatments based on in depth multi-omic and immune profiling of a patient's cancer.*

A multidisciplinary team of experts meet weekly at a Molecular Tumor Board to review patient cases in order develop the most personalized and precise treatment plan for each patient.

The treatment plan may include investigational therapies that may be accessed through numerous innovative biomarker driven-clinical trials at the MCW Cancer Center.

MCW Rare Cancers and Precision Medicine Clinic

Which patients should be referred?

This clinic is intended to serve unmet needs of the following patients:

1. **Patients with any type of cancer for whom the referring physician believes a precision medicine consult, guided by specialized genomic, transcriptomic, immunomic or functional analysis will be helpful to identify therapies.**

2. **Patients with rare or ultra-rare cancer types.**

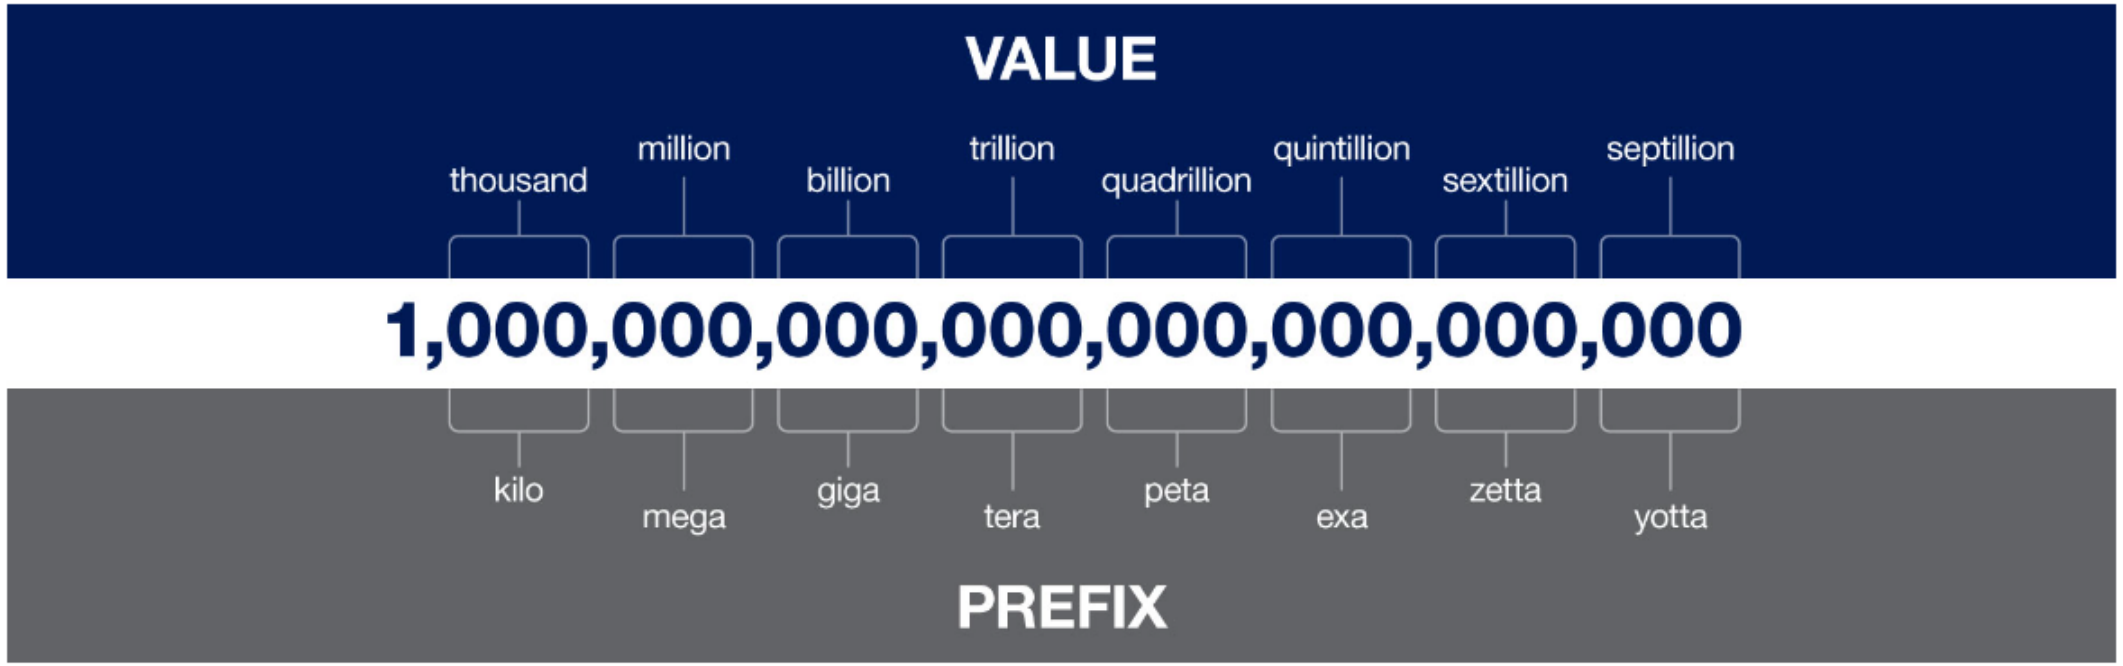
Why is there a need for AI/ML in genomics?

As of 2021, 20 years have passed since the landmark completion of the draft human genome sequence. This milestone has led to the generation of an extraordinary amount of genomic data. Estimates predict that genomics research will generate between **2 and 40 exabytes** of data within the next decade.



DNA sequencing and other biological techniques will continue to increase the number and complexity of such data sets. This is why genomics researchers need AI/ML-based computational tools that can handle, extract and interpret the valuable information hidden within this large trove of data.
